

Tata Steel Jamshedpur - Emergency Services Operational Policy

For estimating arrival times, control room should assume that ambulances and fire trucks travel at about 40 kilometres per hour across the township under normal conditions.

Any incident involving more than 3 injured people is to be treated as a mass-casualty event. In such cases dispatch roughly one ambulance for every 4 casualties, and in no situation send more than 10 ambulances to a single incident.

If a response has not been completed, the system should automatically close the trip after 12 minutes so the vehicle is freed for the next call.

When triaging, always prioritise critical cases first, then urgent, then normal.
