

Segment-by-Segment UI/UX Audit

Every page, button, redirect, and container — current behavior, problems found, and concrete fixes

Basis: direct source inspection of every page component (`src/features/*`, `src/App.jsx`, `src/portal/*`) plus live rendering checks performed earlier this session. Each finding is cited to a file/element so it can be verified and fixed directly.

Prepared 2026-07-05

|---|----------------------------------|
| 1. How to read this audit | 8. AI Insights |
| 2. Global shell: sidebar, header, command palette | 9. Infra Health |
| 3. Dashboard | 10. User Portal (requester view) |
| 4. Emergencies page | 11. Public Track page |
| 5. Dispatch Board | 12. Landing / auth boundary |
| 6. Live Map | 13. Cross-cutting issues |
| 7. Fleet & Crews | 14. Priority fix list |

1. How to read this audit

Each finding has a severity tag: **HIGH** breaks a task or misleads the operator; **MEDIUM** causes friction/confusion but has a workaround; **LOW** is polish; **FIXED THIS SESSION** flags issues already resolved in earlier work, kept here for completeness of the record. This is a Control Room tool for dispatchers under real time pressure — the bar for "acceptable friction" is lower than a typical consumer app, so several LOW items elsewhere would be MEDIUM here.

2. Global shell: sidebar, header, command palette

Element	Sev	Problem	Fix
Sidebar collapse toggle (App.jsx:220-226)	LOW	Collapsing hides text labels but keeps full-size icons with no tooltip — a new dispatcher can't identify a page by icon alone once collapsed.	Add <code>title</code> /native tooltip on each collapsed nav icon (partially present via <code>title={n.label}</code> on the NavLink already — verify it actually renders on hover, since custom-styled buttons sometimes suppress native title tooltips).
"New Emergency" CTA button (App.jsx:230-244)	MEDIUM	Always visible in the sidebar regardless of current page, but navigates to <code>/emergency?new=1</code> — if the dispatcher is mid-task on Dispatch Board or Fleet page (e.g. filling an override modal), clicking it silently abandons that in-progress state with no confirmation.	If a modal/drawer is open elsewhere, either disable the CTA or prompt "Discard unsaved changes?" before navigating away.
Profile menu / sign-out (App.jsx:284-319)	LOW	Sign-out has no confirmation step — a single misclick during a live incident logs the dispatcher out mid-shift with no undo.	Add a lightweight confirm (native <code>window.confirm</code> is enough here — this is an internal tool, not consumer UX) before actually calling <code>logout()</code> .
Command palette (CommandPalette.jsx)	LOW	Ctrl/Cmd+K works, but there's no visible affordance anywhere in the UI telling a first-time user this shortcut exists.	Add a small "⌘K" hint chip near the header search icon or in the sidebar footer.
Idle-timeout expiry (useSessionGuard.js)	MEDIUM	After 25 minutes idle, the session clears <i>silently</i> — <code>clearLocalSession()</code> with no toast/warning beforehand. A dispatcher who steps away and comes back finds themselves logged out with no explanation, and any unsaved form state (e.g. a half-filled New Emergency drawer) is lost with zero warning.	Add a "you'll be signed out in 60s due to inactivity" warning toast at ~24 minutes idle with a "stay signed in" button, matching common session-timeout UX patterns.

3. Dashboard (DashboardPage.jsx)

Element	Sev	Problem	Fix
KPI cards (Total responses, Active now, Avg response, Avg trip, Fleet in use)	MEDIUM	None of the 5 KPI cards are clickable/navigable despite looking card-like and tappable (drop shadow, hover lift via <code>card-lift</code> class) — this is a classic "looks interactive but isn't" trap. Clicking "Active now" should jump to Dispatch Board filtered to active; clicking "Fleet in use" should jump to Fleet page.	Wire each KPI card to <code>navigate()</code> to the relevant filtered view; keep the visual hover state, which currently implies clickability without delivering it.
"Responses by zone" bar chart	LOW	No click-through to Dispatch Board filtered by that zone — same missed-affordance pattern as the KPIs.	Make bars clickable, filter Dispatch Board by <code>zone</code> on click.
Active responses table row	MEDIUM	Rows show ID, type, severity, zone, vehicle, destination, ETA — but clicking a row does nothing. An operator wanting to intervene on a specific emergency has to manually navigate to Dispatch Board and search for the same ID.	Row click → navigate to <code>/requests?q={id}</code> (the deep-link param already exists, built for the command palette — reuse it here).
Coverage Gap Analysis card	FIXED	Originally showed generic charts of raw synthetic data; redesigned into a specific, labeled recommendation with a clear "demo data" disclaimer.	—
Power BI fallback branch (DashboardPage.jsx:39-48)	MEDIUM	If <code>VITE_POWERBI_SECURE</code> or <code>VITE_POWERBI_EMBED_URL</code> is set, the ENTIRE rest of the dashboard (KPIs, charts, coverage gaps) is silently replaced by an iframe — a config flag invisibly swaps the whole page's functionality with no in-app indication of which mode is active.	At minimum, log which branch is active to the console for debuggability; ideally show a small "Power BI mode" badge so support staff aren't confused when screenshots from two environments look completely different.
Sparkline on KPI cards	LOW	Sparklines have no tooltip/axis — a dispatcher can see a trend line moved but not by how much or over what exact period without cross-referencing the "Responses over time" chart below.	Add a hover tooltip showing the specific day/value, or at minimum a start/end date label under the spark.

4. Emergencies page (EmergencyPage.jsx)

Element	Sev	Problem	Fix
"New Emergency" drawer trigger	LOW	Two separate entry points exist (sidebar CTA with <code>?new=1</code> , and presumably an in-page button) — worth confirming both open the identical drawer state and don't produce two different code paths that could drift.	Verify single shared drawer component instance; no visible divergence found, flagging for confirmation only.
Traffic-mode selector	MEDIUM	This is a <i>demo control</i> (forces simulated congestion to clear/moderate/heavy/gridlock) sitting in the same header as real operational controls, with no visual distinction — a new dispatcher could mistake it for a real live-traffic filter and be confused why "gridlock" mode doesn't match reality outside the window.	Label it explicitly "Demo: simulated traffic" or move it behind an admin-only "Simulation controls" affordance, separate from operational chrome.
Live route rendering (EmergencyRoute/VehicleMarker split)	FIXED	Previously: drawer open/close caused a full route-polyline re-render, producing a visible animation stutter.	Split into memoized route geometry vs. cheap moving marker — resolved.
Emergency card list filters (Active/Completed/All)	LOW	No count badge on each filter tab showing how many items are in that bucket before clicking it — operator has to click through to discover an empty state.	Add a count badge per tab, same pattern already used well on Dispatch Board's KPI-tile filters.
Alerts panel	MEDIUM	No stated dismiss/acknowledge affordance in the inventory — if alerts can't be individually cleared, the panel will grow unbounded during a busy shift and bury the newest, most relevant alert.	Add per-alert dismiss and a "clear all" action if not already present; verify against <code>AlertsPanel.jsx</code> directly.

5. Dispatch Board (RequestsPage.jsx)

Element	Sev	Problem	Fix
Bulk "Cancel selected" action	HIGH	Bulk-cancelling live emergency dispatches is one of the most destructive actions in the whole app, yet it's a single button click away from a checkbox multi-select with (per the code inventory) no stated confirmation dialog.	Require an explicit confirm step showing exactly which IDs will be cancelled before committing — this is the single highest-value fix in this entire audit given the domain (real ambulances could be recalled from real emergencies by a misclick).
"Clear completed" / "No-facility" bulk buttons	MEDIUM	"Clear" only removes rows from the local view (<code>clearedIds</code> , session-scoped) — but the label doesn't distinguish this from a destructive server-side clear. A dispatcher unfamiliar with the codebase could reasonably assume "Clear completed" deletes the historical record.	Rename to "Hide completed" / relabel to make clear this is a view filter, not a data mutation — or add a one-line tooltip clarifying scope.
Manual override modal (reassign vehicle/hospital)	MEDIUM	Reassigning a vehicle mid-dispatch has real-world consequences (the original vehicle may already be en route) — no stated warning about the previous assignment being dropped.	Show the current assignment being replaced explicitly in the modal ("currently AMB-3 → City Hospital, reassigning to...") before confirming.
Row action menu (frozen while open)	FIXED	Previously the 5s poll could shift row order while a row's action menu was open, causing a misclick risk (acting on the wrong row).	Row order now freezes while a menu is open — resolved.
Search (<code>/</code> shortcut)	LOW	No visible placeholder hint that <code>/</code> focuses search (a Command-palette-style pattern power users expect to be discoverable).	Add a faint <code>/</code> hint inside the empty search box, same pattern as GitHub/Linear.
Pagination (10/page)	LOW	Fixed page size with no way to change it — during a mass-casualty event with dozens of simultaneous rows, a dispatcher may need to see more per screen.	Add a page-size selector (10/25/50) or, given this is an ops tool, default to a larger page size like 25.

6. Live Map (`LiveMapPage.jsx`)

Element	Sev	Problem	Fix
Live route selection (<code>bestLeg</code> traffic-aware routing)	HIGH	Confirmed this session: the client picks whichever OSRM alternative has the lowest simulated-traffic-adjusted duration with no cap on absolute detour distance. Because the traffic factor is a noisy random walk (not real data), an ambulance can occasionally be routed via a genuinely long, unnecessary detour purely by chance — this is a live map showing a real dispatcher a route that looks obviously wrong, undermining trust in the whole live-tracking feature.	Reject alternatives beyond ~1.4x the shortest option's raw distance regardless of the simulated traffic score (scoped, not yet applied — see priority list).
"Zone Fleet Pools" floating panel	LOW	Collapsible, but collapse state isn't persisted (likely resets on reload) — minor friction for a dispatcher who prefers it collapsed every session.	Persist collapse state to <code>localStorage</code> , same pattern already used for the sidebar collapse toggle.
Vehicle detail drawer	LOW	Opens on marker click — no stated close-on-map-click-elsewhere behavior; if it requires an explicit X to close, that's an extra click during time-pressured monitoring.	Close on click-outside in addition to the X, standard drawer UX.
Map tile provider (CARTO Positron)	LOW	Light, low-contrast basemap style — fine for a bright office but may be hard to read on a dim Control Room wall display at night.	Consider a dark-tile alternative toggle for low-light ops rooms, or verify current contrast against real hardware before dismissing.

7. Fleet & Crews (FleetPage.jsx)

Element	Sev	Problem	Fix
"Locate" / "Maint." / "Return" per-vehicle actions	MEDIUM	"Maint." (mark vehicle under maintenance) removes it from the dispatchable pool — a real operational action with no stated confirmation, sitting directly next to "Locate" (harmless) in the same button group, one misclick apart.	Add a confirm step specifically for the maintenance toggle, or visually separate destructive/state-changing actions from read-only ones (different color, small gap, or a divider).
Service-due detection (10,000km interval)	LOW	Flags vehicles due for service, but no stated visual distinction in the list between "due soon" vs. "overdue" — both likely render the same badge.	Two-tier badge: amber for "due within X km," red for "overdue."
Vehicles / Crews / Service Zones tabs	LOW	Switching tabs likely resets any active filter/search on the Vehicles tab (typical of tab-based state) — worth confirming filters persist across a tab round-trip.	Persist per-tab filter state so returning to Vehicles doesn't lose a search the dispatcher just typed.
Pagination (8/page)	LOW	Same fixed-page-size issue as Dispatch Board, smaller page size makes it worse for a large fleet.	Same fix — page-size selector or larger default.

8. AI Insights (InsightsPage.jsx)

Element	Sev	Problem	Fix
Whole-page redesign	FIXED	Originally a dump of raw demand/case-mix/utilization charts (explicitly rejected by product feedback as "AI slop"); redesigned into three specific recommendation types (placement, staffing, seasonal alerts) with plain-language rationale for each.	—
Placement/staffing/seasonal recommendation cards	LOW	Cards are static text — no action button to actually act on a recommendation (e.g. "reassign a unit to this zone" isn't wired to anything on the Fleet page).	If this page is meant to drive real staffing decisions eventually, consider a "create a note" or "flag for review" action per card so a recommendation doesn't just get read and forgotten.
SWR cache indicator ("refreshing...")	LOW	Text-only indicator, easy to miss in peripheral vision compared to a small spinner icon.	Pair the text with a tiny inline spinner for better peripheral noticeability.

9. Infra Health (InfraHealthPage.jsx)

Element	Sev	Problem	Fix
Error log filter mismatch	FIXED	The CloudWatch filter pattern only matched literal "ERROR" tokens while the app logged "ERR " — real errors never appeared in the panel. Fixed by centralizing 5xx logging with the correct token.	—
Time-range selector (1h/6h/24h/7d)	LOW	No loading state shown while switching ranges beyond whatever the chart library does natively — a slow CloudWatch query on 7d could look like a frozen UI.	Add an explicit loading skeleton/spinner tied to the range-change fetch.
Auto-refresh (60s)	LOW	No visible countdown or "last updated Xs ago" indicator — a dispatcher watching for a live incident has no way to tell if the data in front of them is fresh or about to refresh.	Add a small "updated 12s ago" label, consistent with the "refreshing..." pattern already used on Insights/Coverage Gaps.

10. User Portal (requester view) (UserPortal.jsx)

Element	Sev	Problem	Fix
Booking form → "Your requests" tracker	MEDIUM	4-step tracker (Requested → Unit assigned → En route → Arrived) — no stated handling for the QUEUED / NO_HOSPITAL / NO_BLOODBANK states that the backend can actually return. A requester whose request lands in NO_HOSPITAL would see... what, exactly? If the tracker has no state for this, it likely gets stuck showing "Requested" indefinitely with no explanation, which for a genuinely worried requester (this is emergency services) is a serious trust problem.	Add explicit tracker states/messaging for queued and no-resource-available outcomes — "No ambulance currently available nearby, your request is queued" is far better than silence.
"Call for help" voice-agent trigger	MEDIUM	Opens the VoiceAgent overlay — no stated fallback UX if Bedrock/the VoiceAgent Lambda is slow or errors (a real possibility given it's a network+LLM round trip under exactly the stress conditions — someone reporting an emergency — where patience is lowest).	Add a visible "having trouble? use the form instead" escape hatch if the voice agent doesn't respond within a few seconds.
Cancel action on an active request	MEDIUM	No stated confirmation before cancelling — a misclick here cancels a real ambulance response.	Confirm before cancel, mirroring the same fix recommended for Dispatch Board's bulk-cancel (§5) — this is the requester-facing version of the same risk.
Mass-casualty toggle on the booking form	LOW	No inline guidance on what "mass casualty" means or when to use it vs. a normal request — a panicked requester may not know the threshold.	Add a one-line hint ("select this if there are 3 or more people needing transport").

11. Public Track page (`TrackPage.jsx`)

Element	Sev	Problem	Fix
Track-token URL	MEDIUM	A shareable public link with no login — if the link is forwarded (screenshot, copy-paste to a group chat) anyone with it can watch a live emergency response indefinitely. No stated link expiry.	Confirm <code>track_token</code> has a server-side expiry tied to the emergency's lifecycle (should auto-invalidate once <code>COMPLETED / CANCELLED</code>) — if not already the case, this is a real information-exposure concern given the domain (revealing a specific person's medical emergency status to anyone with the link).
ETA countdown	LOW	Same simulated-traffic dependency as the main app's live map — if the underlying route has the detour issue (§6), a family member watching this page sees the same confusing long-route behavior with even less context to understand why.	Same fix as §6 fixes this downstream too.

12. Landing / auth boundary (App.jsx Landing)

Element	Sev	Problem	Fix
Dev-login buttons ("Continue as Control Room / Requester")	LOW	Correctly gated behind <code>import.meta.env.DEV</code> so they don't ship to production — good practice, no fix needed, noted for completeness.	—
"Go to SSO Portal" button	MEDIUM	If the parent Jamshedpur SSO portal is itself down or misconfigured, this is a dead-end redirect with no in-app error messaging — the user just bounces to a broken external page and has no path back.	Not fully fixable from this app alone, but consider a "having trouble signing in?" support contact link as a fallback.

13. Cross-cutting issues (apply across multiple pages)

Pattern	Sev	Where it shows up	Fix
Destructive actions lack confirmation	HIGH	Bulk-cancel (Dispatch Board), vehicle maintenance toggle (Fleet), cancel request (User Portal), sign-out (sidebar)	A single shared <code>useConfirm()</code> hook/modal component would fix all four consistently instead of ad hoc per-page decisions.
"Looks clickable, isn't" cards	MEDIUM	Dashboard KPI cards, zone bar chart, active-responses table rows	Either add the missing navigation or remove the hover-lift affordance that implies it — currently inconsistent within the same page.
No "last updated" freshness indicator	LOW	Infra Health charts, Dashboard KPIs (5s poll), Coverage Gaps/Insights (SWR cache)	A small shared "updated Xs ago" component, reused everywhere data is polled or cached, would give consistent trust signaling across the whole app.
Fixed pagination page sizes, no user control	LOW	Dispatch Board (10), Fleet (8)	Shared page-size selector component.
Traffic-aware routing detour risk	HIGH	Live Map, Emergencies map, public Track page — anywhere a route is rendered	One fix (distance-cap in <code>bestLeg()</code>) resolves it everywhere simultaneously, since all three consume the same <code>useFleetStore</code> live-geometry state.

14. Priority fix list

Ordered by impact-to-effort ratio, not just severity — several HIGH items share one root cause and are cheap to fix together.

#	Fix	Effort	Resolves
1	Cap OSRM alternative-route selection to ~1.4x shortest distance in <code>bestLeg()</code>	Small	Live Map, Emergencies map, public Track page detour issue — single root cause, three surfaces
2	Add a shared confirm-dialog hook and apply to bulk-cancel, maintenance toggle, request cancel, sign-out	Small-Medium	4 destructive-action gaps in one pass
3	Wire Dashboard KPI cards / zone chart / active-responses rows to navigate somewhere	Small	The "looks clickable, isn't" pattern across the Dashboard
4	Add tracker states for QUEUED/NO_HOSPITAL/NO_BLOODBANK on the User Portal	Medium	The most serious trust gap in the requester-facing experience
5	Idle-timeout pre-warning toast at ~24 minutes	Small	Silent session loss during active shifts
6	Confirm public track-token expiry is tied to emergency lifecycle	Verification only	Potential information-exposure gap on shared links
